

Working in [p5.js](#) was quite different to what I was used to doing in Unity and C#. Firstly, I found it very convenient that everything from the assets, controls and functions could all be controlled within the script itself, whereas in Unity I had to juggle between writing monobehaviours and then going to the inspector to assign references and such. Although, I felt that as the script became longer it was harder to navigate through. Furthermore, I feel like I gained a little more insight into how game engines work. In particular, I did not initially pay much attention to how colliders worked as it seemed like common sense to me but now that I had to create my own from scratch I have a greater appreciation for the colliders I worked with in Unity and Unreal Engine. It was overall a very simple and beginner friendly way to approach object-oriented programming and it did make me wonder why I am taking this course in Year 3 instead of in Year 2.

I worked on the mini project with Jiaye and we had a vision to make a silly horror version of flappy bird. I worked on the flapping, collisions, game states and also all the assets in the game. Overall, the game turned out much better than I expected based on what I was able to create during the class exercises.
